About

DevOps and SRE

- Senior DevOps and SRE engineer with a track record of owning complex infrastructure end-to-end across cloud, security, and compliance.
- Equally comfortable writing code, architecting systems, and getting into the weeds of a production incident.
- Has operated as the sole infrastructure owner at a fintech startup and as a principal-level engineer at a healthcare company, wearing every hat the role demands.
- Brings an engineering mindset to every problem, whether it's a broken pipeline, a security gap, or an IT department that needs fixing.

Experience

08-2025 -
present

Sunbound Homes - Senior Systems Reliability Engineer

Sunbound is a fintech startup modernizing payments and claims management for senior living operators. Functioning as the sole infrastructure engineer, all SRE, DevOps, security, and compliance work was owned and executed independently.

- Deployed an SSM-based MySQL proxy replacing open, world-accessible database connections with IAM-authenticated access.
- Improved CI/CD pipeline performance and reliability across the board.
- Built a server software version tracking database with EOL dates across the entire stack and volunteered to upgrade the payments system to Node 24 LTS, handling everything from testing to production deployment.
- Identified that the payments system password security was using far too few hashing iterations, proved it was a security risk, and shipped the fix myself.
- Designed and implemented a tag-based, forward-only deployment process with immutable snapshots to replace a release branch/cherry-pick model causing environment drift.
- Migrated all RDS databases out of public subnets and into private subnets.
- Enabled encryption at rest on all RDS databases across all environments.
- Removed static AWS credentials from environment files, CI/CD variables, and EC2 instances, replacing them with IAM roles and instance profiles.
- Hardened the Google Workspace admin account model with dedicated isolated admin accounts, 2FA enforced org-wide, and no account recovery vectors to eliminate SIM-swap attack paths.
- Centralized logging across all AWS environments and wired CloudWatch alarms to Slack.
- Stood up AWS Identity Center from scratch, consolidated IAM across all accounts, and migrated users from static access keys to SSO with least-privilege permission sets.

Education

University of Central Florida

Bachelor's in Digital Media

Central Florida Community College

Associate's Degree

05-2021 - 08-2025

- Created a new AWS organization and enrolled all environments as member accounts.
- Drove SOC 1 readiness work including a full user access review, change control process, and Business Associate Agreements with all PHI-handling vendors.
- Set up Apple Business Manager and evaluated MDM solutions across device platforms, producing a written proposal covering options, risks, and costs.

Quartet Health - Senior DevOps/SRE Engineer

Quartet Health is a digital mental health company. Joined as a DevOps engineer and grew into the de facto owner of infrastructure, security, compliance, and IT as the company scaled and the role demanded more.

- Identified that EKS was creating unsustainable operational burden for a two-person team, made the case to migrate to Fargate, and executed it.
- Migrated Quartet's aged self-hosted SFTP server setup from a single server to AWS Transfer Family. This resulted in an increase in security for our clients and a reduction in maintenance complexity.
- Implemented Atlantis for handling Terraform via GitOps.
- Replaced an over-engineered VPN infrastructure with a custom OpenVPN solution when the legacy system failed and couldn't be repaired, reducing operational burden while seamlessly supporting 250+ users.
- Fully automated Informatica infrastructure setup via Terraform and EC2 userdata scripts, defying vendor defaults and contractor recommendations by building a maintainable, reproducible environment instead of a manual one-off.
- Provided guidance and mentorship for all engineers on best practices regarding AWS, CI/CD methodologies.
- Significantly reduced AWS costs, including cutting S3 spend by \$5,000/month by reducing standard storage from 1.1PB to 400TB through intelligent tiering and removal of unneeded data.
- Worked hand-in-hand with the security team to ensure HIPAA and SOC2 compliance for our entire infrastructure.
- Deployed Darktrace across our entire IT infrastructure (Cloud and individual laptops) for security monitoring purposes.
- Deployed Rapid7 across our entire IT infrastructure (Cloud and individual laptops) for security monitoring purposes.
- Volunteered as interim IT manager during a department transition, discovered and systematically exposed an IT contractor who had been stealing company laptops for over a year, ultimately leading to his termination and an FBI investigation.
- Migrated the IT Support team's Apple MDM solution from Jamf to Kandji.
- Migrated the IT Support teams' Windows MDM solution from ConnectWise to Microsoft Intune.
- Served as de facto Google Workspace and O365 administrator, handling everything from user provisioning to security investigations.

- Managed and maintained Quartet's self-hosted Github Enterprise Environment.
- Significantly improved the IT department's overall security posture by fully automating updates for all user control machines.
- Implemented Okta as the company's new SSO platform.
- Overhauled the IT support workflow by implementing remote desktop access, streamlining ticket creation, and building a self-service system that routed requests directly to on-call staff via Slack and LogMeIn.

09-2020 -
05-2021

Voice.com - *DevOps Engineer*

DevOps engineer for Voice.com, a social network built on the EOSIO blockchain.

- Managed and maintained Voice's GCP and Kubernetes environments.
- Became familiar with blockchain technology. Specifically the EOSIO blockchain framework.
- Was instrumental in streamlining a massive lift-and-shift migration from Block.one's infrastructure to Voice's. Migrated services included multiple Kubernetes clusters, over 200 GitHub repositories, PostgreSQL databases, CI/CD pipelines, and DNS records, and NPM packages.
- Streamlined their CloudFlare and PagerDuty accounts by managing them via Terraform and buildkite.
- Became their go-to resource for tricky Terraform and Bash related issues.

08-2019 -
09-2020

AiCure - *DevOps Engineer*

DevOps engineer for AiCure, creators of a machine learning based mobile app that assists patients in clinical trials.

- Overhauled AiCure's code deployment process to make it a true CI/CD process
- Made AiCure's existing services more resilient by implementing optimizations like container autoscaling
- Made use of Lambda functions to reduce cost and make management of infrastructure easier to maintain

01-2018 -
08-2019

Univision - *DevOps Engineer*

DevOps engineer for most of Univision's online presence

- Built custom tooling to automate and provide accountability for the entirety of Univision's and Gizmodo Media Group's DNS infrastructure
- Containerized and automated Univision's Jenkins environment
- Rebuilt Univision's AWS environment entirely in CloudFormation
- Brought visibility to cost of operation of all Univision AWS accounts via CloudHealth
- Implemented CI/CD pipelines to test and automate other processes wherever possible
- Migrated their deployments from ECS to Kubernetes
- Became DevOps lead by default and rose to the increase in responsibilities
